**Potential competing interests:** No potential competing interests to declare.

There are many positives out of these like the analysis and detailed study. I am pointing out the critical remarks for the review purpose.

- The introduction is not very well written and it lacks background studies with depth.
- Also, there has been several approaches to model both waves together with same equations and why your method should be prioritized on that is not very clear.
- Should mention generalizations of the results
- Seems like no drawback mentioned
- Will be nice to have fatality data modeled because it seems like nothing involved there as only the data is reported in the paper which anyone can do using a search
