Cutis marmorata telangiectatica congenita

INSERM

Source

INSERM. (1999). *Orphanet: an online rare disease and orphan drug data base*. *Cutis marmorata telangiectatica congenita*. ORPHA:1556

Cutis marmorata telangiectatica congenita (CMTc) is a congenital localized or generalized vascular anomaly characterized by a persistent cutis marmorata pattern with a marbled bluish to deep purple appearance, spider nevus-like telangiectasia, phlebectasia and, occasionally, ulceration and atrophy of the affected skin.
