This study demonstrates the beautiful comprehensive output of the scholarly literature on leishmaniasis. It contains substantial references for researchers, scientists who work in the field of leishmaniasis.

The abstract is satisfactory as per the findings of the study. However, the clear-cut study objective lacks in the abstract what is required to conduct this study. So, recommendations to put important words in the background that address the goal of this study.

There is still a requirement for further improvement in the discussion section; since this study has a lot of limitations (such as duplication of data, different forms of leishmaniasis, certain geographical regions), more scientific review could be possible if such limitations are reduced. This increased number of research in leishmaniasis shows the interesting creativity in the coming days.

Finally, this is excellent work of reviewing leishmaniasis.
