Interesting review article on a fruit found in Malaysian-Indonesian islands. The information is interesting and important, and it provides new points of view about food, fruit that can also be compared with fruits from other regions or countries.

Some suggestions for improvement:

The author described the fruit of one species, *Rubus fraxinifolius*, as having potential uses for medicine. It is important to note that there are other species in other places. The paper presented is important, but needs to describe data on nutritional contents.

The potential use of this berry in the future should also be more elaborated to give the readers more perspective on the need to preserve this wild berry in nature.

The author should check the journal's format for references. A review article needs more articles to support the study, and the present manuscript is too short for a review paper.

In conclusion, I suggest that the manuscript may be published after revisions have been made.
