This is one very nice and interesting paper.

It consists of:

Abstract

1. Introduction

2. Tools of the Embodied Mind

3. Genesis of Cognition

4. Models of Reality

5. The Language of Artificial Networks

6. Summary and Conclusion

Everything is followed by a good and relevant list of references.

This paper is well-structured and consistent. The whole concept of semblions is original and new. But I do not like papers without photos or figures; they are not so readable in this form. My suggestion to the authors is to try to illustrate this work a little bit.

This article is some kind of innovative exploration of cognitive linguistics. I like the mixing of neural representation in human networks and artificial networks. I like the interdisciplinary nature of this paper.

I definitely recommend this paper for publication.
