# Myxoinflammatory Fibroblastic Sarcoma

National Cancer Institute

## Source

National Cancer Institute. *Myxoinflammatory Fibroblastic Sarcoma*. NCI Thesaurus. Code C49025.

A low grade, locally aggressive, fibroblastic neoplasm that occurs primarily in the distal extremities. It is characterized by the presence of spindle-shaped fibroblasts, multivacuolated lipoblast-like cells, bizarre ganglion-like cells with inclusion-like nuclei, myxoid stroma formation, and a mixture of acute and chronic inflammatory cells. Distant metastases are very rare.
