The issue of cybersecurity is becoming one of the key research areas. The idea of a smart city is to create and exploit relationships and linkages between human and social capital and information and communication technologies in order to generate sustainable economic growth of the city and improve the quality of life of its residents. Therefore, I consider the choice of the research problem and the formulation of the topic of the article to be apt and of great importance for both theoretical considerations and practical considerations. The good thing about the article is that the authors used structured material to set interesting research hypotheses. The presented conclusions and their explications are correct and try to solve the stated goals. The work is readable and clear. The content of the individual chapters corresponds to the order of the scientific problems adopted for study. The article was prepared correctly in terms of editing and content. The overall scientific value of the article and the cognitively important and practical conclusions formulated in it can contribute to further research.
