**Potential competing interests:** There are no potential competing interests to declare.

This study emphasizes the importance of a comprehensive One Health approach to controlling mosquito-borne diseases in Indonesia. This short article explains the role of all relevant stakeholders in accelerating the implementation of the One Health approach or program in Indonesia, what to focus on, and the main keys to controlling mosquitoes as disease-carrying vectors in a concise and easy-to-understand manner.

However, this article needs to add a little review regarding "how the One Health concept is applied in Indonesia, especially in controlling dengue, chikungunya, zika, and other diseases?" Although the author has clarified that "traditional approaches to mosquito control focus mainly on insecticides and eradication at breeding sites," if this is added, it will provide information and corroborate the information already described.

As a whole, this article updates the importance of strengthening policies in Indonesia, especially in the control and eradication of mosquito-borne diseases in the future.
