**Title: Recent Trends and Techniques in Landslide Hazard Assessment.**

## Reviewer Comments

### General Comments:

The paper discusses recent trends and techniques in landslide hazard assessment. The topic is very ambitious. The GIS method used, unfortunately, is not presented clearly. Furthermore, no dedicated results and discussion paragraph has been shown.

### Weaknesses of this paper:

The main weakness lies in the limitation of the study area, which is concentrated solely in the country of India.

### Title, Keywords, and Abstract.

The paper has a suitable title, but it should specify the study area as the "country of India." No keywords are provided to reflect the purpose of the paper, and there is no mention of the obtained results in the abstract.

### Introduction:

The background of the study briefly mentions the most commonly used methods, but it lacks a bit of explanation about what these methods entail.

### Figures and Tables:

The figures appear to be very vulnerable, possibly indicating that they are not adequately presented or explained.

### Conclusion:

The conclusion section needs improvement.

### Remarks:

- I believe the paper can be accepted after making these modifications.
