

# Review of: "Raising Adaptive Capacity to Climate Change in Energy and Food Sectors of Egypt"

Omar Kebour

**Potential competing interests:** No potential competing interests to declare.

Firstly, one aspect that requires attention is the lack of clarity regarding the author's scientific contribution within the article. It is essential to clearly highlight the unique insights or contributions the author brings to the subject matter, emphasizing the novel aspects of the work.

Secondly, the reliance on references from the 19th century raises concerns about the reliability of the data. In order to ensure the study's credibility and relevance, it is crucial to incorporate more up-to-date references that align with contemporary research and methodologies.

Furthermore, there are instances where unrealistic timelines, such as referencing events up to 2008 in a 2024 context, are mentioned. This discrepancy undermines the accuracy of the study and should be rectified to maintain the relevance of the information presented.

Lastly, addressing formatting issues is imperative for enhancing the overall readability and professionalism of the work. Specifically, a) the figures need to be revisited for clarity and coherence, and b) the table titles should be positioned at the top of the tables rather than at the bottom, adhering to standard formatting conventions.

I believe addressing these points will significantly improve the quality and impact of the work. I am open to further discussions to clarify any of these suggestions and collaborate on refining the content.
