This is a well-written review. Indeed, Heat Stroke (HS) is a life-threatening condition, especially in patients with comorbidities. Nowadays, with climate change being a global reality, it would be very critical to address such risks. The review is well-structured and points out the significance of preventive measures, since HS in the late phase rarely can be reversed. Nonetheless, could you provide a specific example or evidence to support the significance of the preventive measures discussed? And could you elaborate on how smart ID medical bracelets have improved emergency responses in past events?
