# Inflammatory Pseudotumor-Like Follicular/Fibroblastic Dendritic Cell Sarcoma

National Cancer Institute

## Source

National Cancer Institute. *Inflammatory Pseudotumor-Like Follicular/Fibroblastic Dendritic Cell Sarcoma*. NCI Thesaurus. Code C150704.

A sarcoma that occurs predominantly in young to middle-aged adults, with a marked female predilection. It typically involves the liver or spleen, but both sites may be simultaneously involved. Rarely, it selectively involves the gastrointestinal tract in the form of a polypoid lesion. Patients are asymptomatic or present with abdominal distension or pain, sometimes accompanied by systemic symptoms. Histologically, the neoplastic spindled cells are dispersed within a prominent lymphoplasmacytic infiltrate. Outcome data are limited, but the tumor appears to be indolent, with a tendency to develop repeated intraabdominal recurrences over many years. (WHO 2017)
