Review of: "Beyond Self-Report: Preliminary AI Analysis of Language Related to the Burnout/Depression Relationship"

Juan Manuel Ramos-Arreguín[1]

1. Engineering, Universidad Autónoma de Querétaro, Mexico

This work is relevant and highly timely in terms of the use of existing artificial intelligence platforms. I have the following comments:

1. Specify the version used for each AI platform.

2. I believe it would be helpful to use graphs to present the results, in addition to Table 1, since graphs make it easier to identify patterns and trends than numerical values do.

3. Explain why only ChatGPT and Claude were used.

Acceptance with corrections is recommended.
