

# Review of: "Improving the Integration of Epidemiological Data Into Human Health Risk Assessment: What Risk Assessors Told Us They Want"

Heba Alshater

Potential competing interests: No potential competing interests to declare.

This article aims to improve the integration of epidemiological data into human health risk assessment. The authors collected important information and carried out the analysis, but there is a lack of data regarding environmental exposure to chemicals, toxins, or agents harmful to health, an area in which occupational medicine has a lot to investigate. Also, there is a lack of biosafety standards, so there is a poor epidemiological record of environmental risk factors. Besides, the references are few; 8 references are not sufficient for this study. The study lacks a clear statement of its objectives, and no validation is provided for the survey. Authors must add keywords after the abstract. The whole paper needs to be revised with Grammarly. The introduction is too short. Tables should be improved.
