After careful consideration and thorough review, I regret to inform you that in its current form, your manuscript cannot be accepted for publication. There are several critical areas that require substantial revision and attention. First, the methodology section lacks detailed explanations of the processes and parameters, which are crucial for replicating your study and validating your claims. Additionally, the results are not presented clearly enough to ascertain the effectiveness of your proposed CNN model. There is also a noticeable absence of a comprehensive discussion on how your findings compare with existing research, particularly in addressing limitations and potential for real-world application. Furthermore, the literature review does not adequately support the research hypothesis or connect clearly with the research objectives. To move forward, these issues would need to be addressed in depth to meet the publication standards of our journal.
