Dear Authors,

Thanks for the chance to review the manuscript entitled "Local delivery of hydrogel encapsulated vascular endothelial growth factor for the prevention of medication-related osteonecrosis of the jaw".

I think it is a very interesting and valuable study.

In this study, VEGF hydrogel was used to prevent the development of MRONJ. Could it be effective for the treatment of MRONJ that has already developed?

VEGF inhibitors such as bevacizumab are also considered as the causative drugs of MRONJ. Could VEGF hydrogel be more effective in cases receiving VEGF inhibitor?

I sincerely respect your work.

Sincerely yours.
