Potential competing interests: No potential competing interests to declare.

It is an article that stands between a survey and a statistical analysis. The main advantages are that there is a real case scenario, and tables with the results. The related work should have been more extensive and not in the introduction to give the impression of a survey rather than a simple statistical analysis. In addition some constants are presented (for which there are of course measurements) without being justified by any methodology. The main conclusion is that the article needs a methodology that gives a reason for the existence of the entities examined.
