Ocular cystinosis

INSERM

Source

INSERM. (1999). *Orphanet: an online rare disease and orphan drug data base*. [Ocular cystinosis](#). ORPHA:411641

Ocular cystinosis is the benign, adult form of cystinosis (see this term), a metabolic disease characterized by an accumulation of cystine crystals in the cornea and conjunctiva responsible for tearing and photophobia and associated with no other additional manifestations.
