Review of: "The Influence of Hot Extrusion on The Mechanical and Wear Properties of an Al6063 Metal Matrix Composite Reinforced With Silicon Carbide Particulates"

Elsa Pereyra Laguna¹

1. Independent researcher

It is necessary to consult relevant bibliographic sources that address the same research topic in order to properly contextualize the study and highlight the specific contributions of this work compared to previous studies.

Likewise, it is recommended to improve the quality of the images included in the document and to use a uniform format for their labeling.

The manuscript requires a deeper and more critical discussion of the results obtained.

Finally, it is essential to include the general microstructure of all the compounds, both before and after the extrusion process, in order to provide a more comprehensive characterization of the analyzed materials.
