Src/Abl Kinase Inhibitor AZD0424

National Cancer Institute

Source

National Cancer Institute. *Src/Abl Kinase Inhibitor AZD0424*. NCI Thesaurus. Code C102976.

An orally bioavailable small molecule tyrosine kinase inhibitor that targets both Abl and Src kinases with potential antineoplastic activity. Upon oral administration, AZD0424 selectively inhibits both Src and Abl kinase activity which may result in the inhibition of tumor growth in susceptible tumor cells. Src and Abl kinases are upregulated in certain tumor cells and play important roles in tumor cell proliferation and metastasis.
