

Review of: "New Method to Identify Potential Illegal Water Use Location by Using Remote Sensing and Neural Networks in Laguna de Aculeo, Chile"

Yussef Abud Russell

Potential competing interests: No potential competing interests to declare.

This article adheres to the structure typical of research papers. There is a coherent alignment observed among the title, introduction, methodology, and results. However, given the focus on subterranean and surface phases of the water cycle, there arises a question regarding the validity of deriving data from a satellite image in 2021 concerning the functioning of different phases of the water cycle. It is recommended to approach this aspect with a critical perspective. Apart from this, congratulations to the authors for their commendable effort.
