

Review of: "Microsatellite Instability of Colon adenocarcinomas in India comprises multiple molecular subtypes"

Ankita Soni

Potential competing interests: No potential competing interests to declare.

- The subject of the article is surely interesting but the Aims and objectives of the study are not clear.
- Sample size is too small n methodology to come to this sample size has not been discussed. With this small sample size, a reliable inference could not be attained.
- The authors seem to have deviated from the study's actual purpose in results and discussion.
- There are many recent studies related to the prevalence of MSI-CRC in India. The authors should have taken the methodology for the estimation of the MSI-CRC.
- The references are not cited in the correct manner.
- Conclusion can never have references to another study.
- Thus, for me, this appears to be unsatisfactory work.
