Thank you for this interesting article in an important issue.

I would consider the following points and revise as well to improve the article.

Abstract : It would be better if the result tell some thing on the demographics of the study children as the title suggested. The conclusion also better say a point about the demographics as well in addition to the clinical characterization.

Methods : It is good if some terms are defined e.g. How the ER system classify illness on triage as Red, Green or Yellow.

Results : Do we know the diagnosis rather than reporting the symptoms / the system as a whole like Upper respiratory disease?

Discussion : Consider to summarize the discussion a little shorter. It appears too long as it is now. Also, consider merging paragraph 7 and 8 as both are same issues ( Vaccine preventable disease related).

Conclusion : Not directly related to teh topic and objective , Please revise. The points raised in the conclusion , while important , can be raise din the discussion with implications in the study.
