Isolated Dandy-Walker malformation

INSERM

Source

INSERM. (1999). *Orphanet: an online rare disease and orphan drug data base. Isolated Dandy-Walker malformation. ORPHA:217*

Dandy-Walker malformation (DWM) is the association of three signs: hydrocephalus, partial or complete absence of the cerebellar vermis, and posterior fossa cyst contiguous with the fourth ventricle, presenting early in life with hydrocephalus, bulging occiput and posterior fossa signs such as cranial nerve palsies, nystagmus and ataxia.
