This is Ram Baran Verma. This is a review of [Some Results on Maxima and Minima of Real Functions of Vector Variables: A New Perspective](#). In my opinion, the author tried to give a simple application of the theorem in functional analysis. Theorem 1.1 is a very good observation, as well as the authors also have given many interesting applications through various examples. It can be accepted. I will suggest the following thing: Though the content of the article is very good, it needs to be revised.

1a. In the proof of Theorem 1.1, the authors said that f is defined by written two times.

1b. There are some places where authors do not put \cdot at the end of the statement, like See Equations (9), (10), (24), (25).

If there is some more article dealing with such problems, it should be mentioned in the introduction.
