Review of: "An Approximated QUBO Formulation for Solving Practical SAT Problems"

Arthur Braida[1]

1. Université Libre de Bruxelles, Belgium

I thank the author for the corrections made to the article, which have improved the quality of this work.

The results remain strong but feel somewhat limited. I understand the author's intent to keep the study experimental with minimal theoretical intuition. The focus on "practical" instances is clear, but it would be helpful to provide justification or references explaining why the chosen instances represent "practical" problems.
