# Lung Tissue

National Cancer Institute

## Source

National Cancer Institute. *Lung Tissue*. NCI Thesaurus. Code C33024.

Tissue consisting of an external serous coat, subserous areolar tissue and lung parenchyma. The parenchyma is made up of lobules wound together by connective tissue. A primary lobule consists of a terminal bronchiole, respiratory bronchioles, and alveolar ducts, which communicate with many alveoli, each alveolus being surrounded by a network of capillary blood vessels.
