Potential competing interests: No potential competing interests to declare.

I have completely read the work "Assessment of soil erosion in the Cesar watershed, an initial step toward the restoration of the Cesar River". It was not difficult to read, the general goal is clear and the methodology is correct. I think the topic is important to understand the behavior of the basins for various purposes, especially for the conservation of the ecological services and sustainability of the basin. One of the current problems in many places is that humans do not carry out a comprehensive study of basins before exploiting them. The theme is clear; but, I suggest that the semantics of sample nomination be improved. Perhaps in a table the complete acronym would be mentioned, its meaning were explained and a very easy nomenclature were assigned to follow it in the text, without having to go back. I believe the article is important and should be published.
