Dextroamphetamine-Amphetamine

National Cancer Institute

Source

National Cancer Institute. Dextroamphetamine-Amphetamine. NCI Thesaurus. Code C26643.

A combination of two synthetic agents with central nervous system stimulant activity. Both agents are non-catecholamine, sympathomimetic agents that elevate blood pressure and cause bronchodilation. These agents are commonly abused psychostimulant drugs that induce psychologic dependence manifested by elevated mood, increased wakefulness, concentration, physical performance and a feeling of well-being. Tolerance to various effects develops unequally, so that tachycardia and enhanced alertness diminish while psychotoxic effects (hallucinations and delusions) may occur. (NCI04)
