# Adult Fibrosarcoma

National Cancer Institute

## Source

National Cancer Institute. *Adult Fibrosarcoma*. NCI Thesaurus. Code C7809.

A malignant mesenchymal neoplasm composed of fibroblasts. It is characterized by collagen production and a herringbone architectural pattern. It is more commonly seen in middle-aged and older adults. It usually affects the deep soft tissues of extremities, trunk, head and neck. Adult fibrosarcomas may recur and metastasize to the lungs and bones.
