Potential competing interests: No potential competing interests to declare.

A Review of the Drawdown Zone in African Reservoirs is a comprehensive study that aims to examine the current knowledge, understudied areas, and recommendations for future research in this field. The review focuses on the drawdown zone, which refers to the area of the reservoir that is exposed during periods of low water levels. The authors have identified several areas that require further research, such as the impacts of drawdowns on the ecosystem, sediment transport, and the effects of climate change on water levels. The review provides valuable insights into this area of study and will be of great interest to researchers and policymakers alike.
