

Review of: "Decontamination of Two Umbilical Cord Blood Grafts Prior to Autologous Administration"

Jiexian Ma

Potential competing interests: No potential competing interests to declare.

This research is still very practical in general, but it does not reach a scientific and rigorous level. Although increasing the concentration of antibiotics in the preservation solution will not affect the survival of stem cells and T cells, the author should further explore whether it has an impact on the differentiation and implantation of stem cells, and whether it has an impact on the function of T cells, such as increasing the clinical implantation data, and increasing the data of T cell function in vitro, such as xenograft tumor clearance, cytokine release and other data.
