

Review of: "Factors Influencing the Laptop Buying Behavior of Students in Vietnam"

Tri Pham

Potential competing interests: No potential competing interests to declare.

The author's research topic can be seen as a topical issue, research-oriented on human consumption behavior. Here are some key ideas to discuss with the author:

1. Some of the scientists mentioned in the article are not fully listed in the references.
2. The previous studies' review is too small to support research model building.
3. Selecting the sample by the convenient and random interview method is inappropriate. Data used for research need to be collected by groups of students accepting and not accepting laptop purchases to see the behavior and reactions of buyers to influencing factors.
4. The results of the EFA analysis are not presented fully, so the author should review Table 4 and the reasoning.
5. The results of multivariable regression model estimation show that four independent variables can only explain about 40% of the variation of the dependent variable. The author's explanation isn't present clearly, so these results only depend on four factors (constants are insignificant). In addition, the student's laptop-buying behaviors depend on other factors, such as the financial abilities of students.
