Thanks for sharing this study. I think they did great job because some studies revealed that survey response rate among medical is lower than non medical participants.

Regarding COVID-19 vaccine coverage; 95% is higher than Ulbrinchtova R finding in her study about COVID-19 vaccine among medical student (62%)(https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8998748/) which reflect the interventions that made by Health authorities aand Educationadministration.

My main comment is that more than 200 out 605 didn't answer question about testing COVID-19 whether by PCR, RAT or Anitbody and this could affect the overall proportion of COVID-19 status. This study found that COVID-19 frequency among students is 31% and I think its high because medical students are at a lower risk for contracting COVID-19 compared to working medical doctor. for example our study found that 13.6% of medical doctors included in the study were tested positive COVID-19 in Khartoum, Sudan.
