Although the paper is interesting, well written and easy to read, I still have few remarks which authors should take into account:Ex

1. A more comprehensive review of what has been done in this field should be done. has anything similar be done before? Or is this a first attempt to analyze this phenomenon? What is the novelty of this work?
2. What is the uncertainty of experimental measurements? Is the single measurement enough for reliable results?
3. Experimental conditions should be explained more thoroughly. What are velocities in advection cases? What is the bottle position in respect of fan and other bottles?
4. I also agree with comments made by other reviews including influence of the porosity and layers of paper to evaporation rate, etc.
