Potential competing interests: No potential competing interests to declare.

1. As a review paper, most of the content is taken from the literature. But to address the main crust of the paper, the literature survey requires a bit of improvement. More data should be presented relevant to smart grids, such as what kind of topologies researchers are using to implement the smart grids.
2. Apart from this, Figure 5 also requires some kind of improvement with respect to transmission, distribution, and generation.
