The manuscript is accepted. It presents Kalya Research as a practical, well-scoped virtual assistant for CAM and non-pharmacological interventions, pairing curated lexicons with rule-based retrieval and clear visual analytics. The alopecia case study illustrates tangible value: faster, simpler query formulation and broader, more relevant recall than a complex PubMed baseline, while preserving interpretability. The modular architecture, daily updates, and saved-query notifications support sustained use by clinicians and researchers. Overall, the paper is clear, focused, and useful to the community, and the tool addresses a real gap in CAM literature triage. I recommend publication in its present form, without further revision.
