Review of: "Cross-national associations of IQ and infectious diseases: Is the prevalence of Corona an exceptional case?"

Robabe Khalili

Potential competing interests: No potential competing interests to declare.

- Topic of this article is related to COVID 19 not infection diseases, and also in the content except for intelligence, some effective factors have been evaluated in the world that impact on dissemination of disease. Thus, in my opinion this topic need to be revised so that writer to be able acquire the meaning of study.
- Abstract section: (background is too long and need to summarized more. the aim of study didnot mention in this section.) Method in abstract section is unclear, (there is no data gathering or the approach of population volume or sampling and how to data analysis? and using model)
- Introduction is too long, time taking and with details, it could be summarized more.
- Discussion is weak. Results of this study need to be interpreted and supported based on evidence.
