Potential competing interests: No potential competing interests to declare.

I appreciate the current revision. There may yet be room for improvement in the manuscript's methodology section, especially when it comes to clearly defining inclusion and exclusion criteria and offering operational definitions. Additionally, it is more difficult to comprehend important variables and measuring techniques when there aren't clear operational definitions. For the study to be more rigorous and easier to repeat and evaluate, the methodology section must be revised to incorporate clear inclusion/exclusion criteria and comprehensive operational definitions. I'm excited to read the updated version shortly.
