Very relevant topic and interesting findings from the named examples, but not enough detail to show if this is a problem of individual data sets or systematic affects all data sets from certain data bases. More detailed analysis (or presentation of the executed analysis) is needed with much more detail, data and statistical analysis of the different data bases on ozone depletion. So a strong extension of the methodology and results part is suggested.

Regarding the discussion, some words how the found differences would affect LCAs done according to PEF incl. the normalisation would be affected based on the chosen data base, would be very interesting.
