# Review of: "The Influence of Glycemic Status and Sociodemographic Factors on Patients' Dental Caries Risk and Experience in Lagos, Nigeria"

Swet Nisha<sup>1</sup>

1. West Bengal University of Health Sciences, Kolkata, India

Methodology: Sample size calculation is not given. Any software used for calculation and whether it was based on prevalence or a previous study in a similar population could be taken into consideration.

Results: The total number of tables could be reduced; tables 3 and 4 could be combined, and data presentation could be more concise.

Discussion: Overall, the research question is in line with the methodology and results.

Statistics: The data presentation looks fine.

Reference section: Listing references from the last five years would be more appropriate; the majority of references are more than 10 years old. Many new articles related to this study have been published in the last five years. A recent meta-analysis on diabetes and oral health is also available, which can be looked at for other related articles.

The manuscript can be accepted with minor revisions.
