Potential competing interests: No potential competing interests to declare.

- This work is interesting since herbal drugs may be a safe and effective approach to treating infectious illnesses. It's an important article aimed at exploring the outcomes of preclinical and clinical investigations on the antibacterial and antifungal properties of *Ganoderma* species.
- Abbreviations should be defined at first mention and used consistently thereafter.
- The abstract offers an accurate summary of the paper. However, it lacks a clear purpose for the article.
- It is preferable to include an introduction after the abstract, to include the background, the scientific importance of the investigation, in addition to the objectives of the article.
- The article covered antibacterial activity fairly comprehensively, but it did not cover antifungal activity sufficiently. Therefore, it would be preferable if it had included a separate and detailed section about that for more clarity.
- Table 1: It is not cited in the text, and no title is included for this table.
- Grammar needs some revision along the article.
