

Review of: "Assessment of Urban Health Extension Package Utilization and Healthcare Seeking Behavior among Model and Non-Model Households in Addis Ababa, Ethiopia"

Marie-José Essi

Potential competing interests: No potential competing interests to declare.

Title: Assessment of extension or health care behavior?

Methodology: Comparative, cohort survey, or case control? About sample criteria, households or gender households?

Results: Logistic regression does not look for associations between knowledge and behavior, and knowledge with service utilization. Therefore, a multivariate logistic regression should refine the results by looking for the level of association between the three independent variables and the extension of the UHEP program & healthcare-seeking behavior.

Discussion: The discussion should be conducted in connection with the extension of the program and only for variables significant to the adoption of health behaviors.
