It's great that the authors are being encouraged to provide a more comprehensive review of the current knowledge on the reproductive biology of this fish. The authors should also justify the need for their study since there were a few papers on the reproductive biology of this fish in other areas. It's also important to consider incorporating Fulton's condition factor calculation and a histological study for a more thorough analysis. Adding error bars to Figures 5 and 6 would enhance the presentation of results. In the discussion section, it would be beneficial for the authors to not only compare their results with others but also to synthesize new knowledge from their own data and potentially explore how their findings contribute to the broader understanding of this species.
