Agile learning is an innovative educator curriculum that aims to create a responsive, collaborative, and adaptive learning culture. This learning is inspired by the agile software development methodology, which values individuals and interactions, working software, customer collaboration, and responding to change. Agile learning applies these principles to the educational context, where students are empowered to self-direct their learning, work in teams, and deliver products that demonstrate their understanding. Agile learning also helps educators design and facilitate learning experiences aligned with their student's needs and interests and continuously improve their practice through feedback and reflection.
