Potential competing interests: No potential competing interests to declare.

This article eloquently delves into humanity's historical stewardship of biodiversity, accentuating the pivotal role indigenous and pre-industrial societies played in nurturing ecological richness. It illuminates the profound influence of traditional agricultural methodologies, such as agroforestry and domestication, in fostering diversity across ecosystems, taxa, and genetics. Moreover, it critically scrutinizes the deleterious ramifications of industrial advancement, notably the Green Revolution, on biodiversity depletion. By championing the imperative of safeguarding genetic purity and ancestral landraces, it advocates for a paradigm shift towards fostering a biodiversity-centric ethos in contemporary societies. In essence, it presents a compelling narrative that underscores the sacred duty of humanity in preserving the natural world.
