I believe it would be more effective to illustrate this information with graphs, such as those showing monthly temperature, rainfall, precipitation, and data from entomology studies, rather than relying solely on theoretical explanations. Graphs can provide a clear visual representation of trends and patterns, making the information easier to understand and interpret. For instance, plotting monthly temperature and rainfall data can reveal seasonal variations, while visualizing entomology study results can highlight fluctuations in insect populations. This graphical approach can enhance comprehension and facilitate more effective communication of complex data.
