Potential competing interests: No potential competing interests to declare.

It appears that the paper lacks meaningful contributions to both public health and geographical information systems (GIS). Additionally, the absence of empirical results is a notable limitation.

To address these issues, consider the following revisions:

Title Alignment: Ensure that the title accurately reflects the content of the paper. If the current title does not adequately convey the focus of the research, consider revising it to better match the paper's objectives.

Contributions: Explicitly state the contributions of the paper in the introduction or abstract. Highlight how the proposed clustering method impacts the field of epidemiology or GIS. For instance, discuss how it addresses existing gaps, improves existing techniques, or provides novel insights.

Empirical Results: To strengthen the paper, include empirical results. Describe the data used, the methodology applied, and the outcomes obtained. Present visualizations, statistical analyses, or any other relevant evidence to support your claims.

Discussion: Engage in a thorough discussion of the implications of your findings. How do the clustering results inform public health decisions or enhance GIS applications? Consider the practical implications and potential real-world impact.

Remember that a well-structured paper not only presents the method but also contextualizes it within the broader scientific landscape. By addressing these points, you can enhance the paper's quality and relevance.
