Large congenital melanocytic nevus

INSERM

Source

INSERM. (1999). Orphanet: an online rare disease and orphan drug data base. Large congenital melanocytic nevus. ORPHA:626

A large, or giant, congenital melanocytic nevus (LCMN or GCMN) is a pigmented skin lesion of more than 20 cm - or 40 cm- respectively, projected adult diameter, composed of melanocytes, and presenting with an elevated risk of malignant transformation.
