Dear Authors,

I was delighted to reconsider the paper entitled " Bisphosphonate-Related Osteonecrosis of the Jaws Treated with Platelet-Rich Plasma: Preliminary Results from a Case Series".

I set up the content of the paper veritably intriguing, well- penned and organized. still, I suggest many adaptations

- In the ideal section, keywords should be fitted to grease the hunt of compendiums

the limitations of the study are missing. The restriction of the study is the low number of cases enrolled and the absence of a control group.

- To support the election of cases enrolled in the study, it's passed to define the addition and rejection criteria for choosing cases.

- The format of the numbers should be agreed with the guidelines of the storage.

common works well done, but there are miscalculations in the alphabet and dotting, as words are miswritten. There are double-barreled spaces to be excluded in the jotting of the handwriting.
